PROFILE

Independent AI researcher focused on collaborative intelligence and human-AI alignment. Developing novel methodologies for capability expansion and exploring the intersection of alignment and capability self-knowledge. Deep practitioner of advanced AI collaboration techniques with emphasis on empirical testing and systematic framework development.

RESEARCH FOCUS

Collaborative Intelligence Methodology

Developing and testing systematic approaches to human-AI collaboration that extend beyond conventional prompting. Created frameworks for capability expansion through structured predict-attempt-assess-refine cycles. Empirically testing methods to optimize AI reasoning and output quality through collaborative interaction patterns.

Alignment as Capability Self-Knowledge

Investigating the hypothesis that AI alignment may fundamentally be a capability self-knowledge problem. Exploring Layer 1/Layer 2 cognitive distinctions in large language models and their implications for safety and interpretability. Developing frameworks for understanding how models represent and access their own capabilities.

Synthesis Technology

Building systematic approaches to knowledge synthesis and educational delivery using AI collaboration. Designed 31-stage Complete Creation Framework for business and technical development. Testing methods for personalized educational experiences through AI-assisted synthesis.

SELECTED PROJECTS

- **Capability Expansion Research** — Systematic methodology for extending AI reasoning through structured collaboration. Documented emergent behaviors and capability boundaries through empirical testing.
- **Mathematical Problem-Solving Collaboration** — Applied collaborative intelligence methodology to complex mathematical proofs including work on the Collatz conjecture cycle uniqueness problem. Demonstrated novel approaches to human-AI joint reasoning on hard problems.
- **APX Instinct** — AI education platform built on collaborative intelligence principles. Achieved 85% conversion rate in pilot seminars. Developing scalable methodology for teaching effective human-AI collaboration.
- **Automated Document Processing Systems** — Built production AI systems for document extraction, categorization, and analysis. Demonstrated practical application of AI collaboration methodology in complex technical domains.

TECHNICAL SKILLS

AI/ML: Prompt engineering, collaborative intelligence methodology, capability expansion techniques, AI safety concepts, alignment research, systematic AI testing

Development: Python, JavaScript, HTML/CSS, API integration, automation systems, web development

Research: Empirical methodology, framework development, technical writing, systematic documentation

ADDITIONAL

- 15+ years experience in consulting and technical project management (PMP certified)
- Strong background in financial modeling and business development
- Published research: [Link to LessWrong/Alignment Forum post — add after publication]

EDUCATION

High School Diploma · Self-directed research in AI collaboration, alignment, and theoretical physics
(2025-present)
